Kenapa Tensor?

- Bayangkan ada $28 \times 28 \times 32 \times 28 \times 28 \times 32 \times 14 \times 14 \times 64 \times 14 \times 14 \times 64 \times 7 \times 7 \times 3136 \times 128 \times 128 \times 10$ operasi
- Tensor ~ kontainer yang menyimpan data multidimensional
→ operasi matematika dapat dilakukan dengan efisien antar tensors

Operation with Tensors

Addition and Substraction

Penjumlahan/pengurangan tensor sama dengan menjumlahkan/mengurangkan setiap element tensor pada posisi yang sama (*element-wise*).

$$\begin{matrix} m \times n & m \times n & m \times n \\ \mathbf{A} + \mathbf{B} = \mathbf{C} \end{matrix}$$

dengan $A_{i,j} + B_{i,j} = C_{i,j}$

Contoh: $\begin{bmatrix} 1 & 3 \\ 1 & 0 \\ 1 & 2 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 7 & 5 \\ 2 & 1 \end{bmatrix} = \begin{bmatrix} 1+0 & 3+0 \\ 1+7 & 0+5 \\ 1+2 & 2+1 \end{bmatrix} = \begin{bmatrix} 1 & 3 \\ 8 & 5 \\ 3 & 3 \end{bmatrix}$

Operation with Tensors

Multiplication

Matrix product A dan B akan menghasilkan C, dengan syarat, dimensi A adalah $m \times n$ dan dimensi B adalah $n \times p$ yang menghasilkan C dengan dimensi $m \times p$

$$m \times n \quad n \times p \qquad m \times p$$

$$\mathbf{A} \mathbf{B} = \mathbf{C}$$

$$\sum_k A_{i,k} B_{k,j} = C_{i,j}$$

$$c_{11} = a_{11}b_{11} + a_{12}b_{21} + a_{13}b_{31} + a_{14}b_{41}$$

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} & b_{13} \\ b_{21} & b_{22} & b_{23} \\ b_{31} & b_{32} & b_{33} \\ b_{41} & b_{42} & b_{43} \end{bmatrix} = \begin{bmatrix} c_{11} & c_{12} & c_{13} \\ c_{21} & c_{22} & c_{23} \end{bmatrix}$$

$2 \times 4 \qquad 4 \times 3 \qquad 2 \times 3$

$$c_{22} = a_{21}b_{12} + a_{22}b_{22} + a_{23}b_{32} + a_{24}b_{42}$$

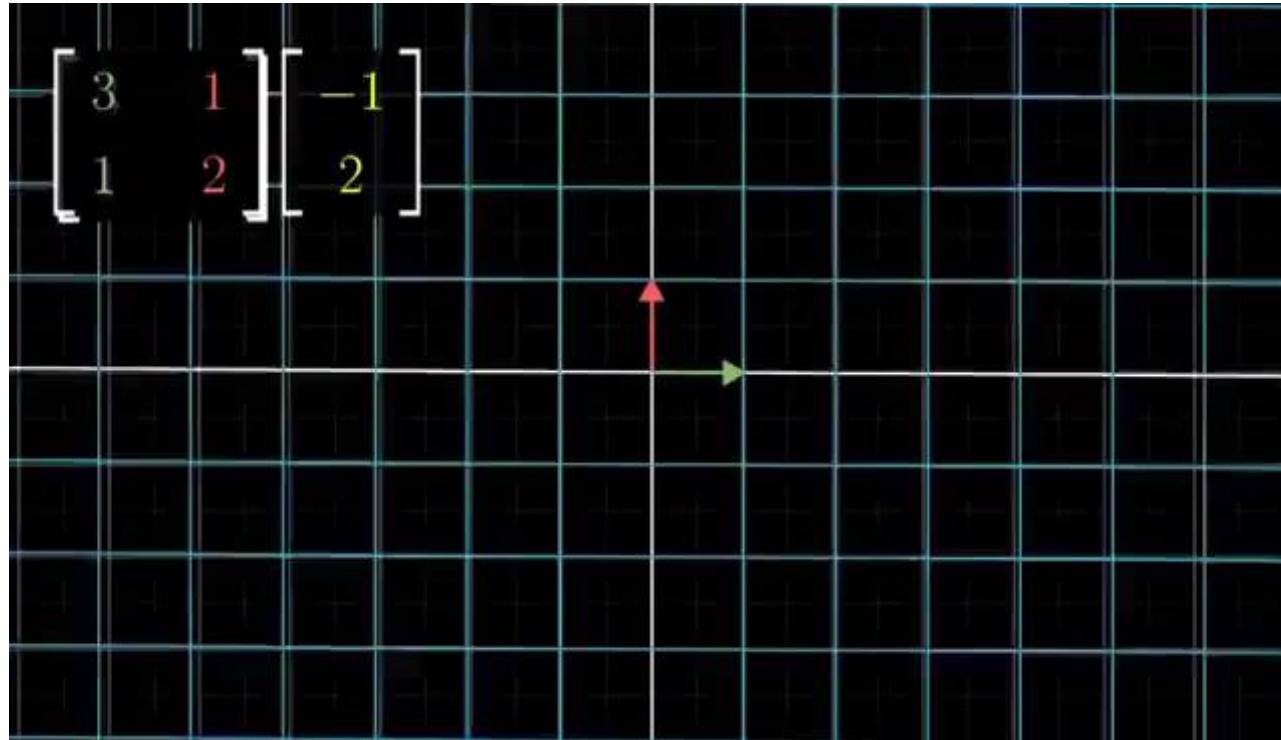

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} & b_{13} \\ b_{21} & b_{22} & b_{23} \\ b_{31} & b_{32} & b_{33} \\ b_{41} & b_{42} & b_{43} \end{bmatrix} = \begin{bmatrix} c_{11} & c_{12} & c_{13} \\ c_{21} & c_{22} & c_{23} \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \times \begin{bmatrix} 10 & 11 \\ 20 & 21 \\ 30 & 31 \end{bmatrix}$$

$$= \begin{bmatrix} 1 \times 10 + 2 \times 20 + 3 \times 30 & 1 \times 11 + 2 \times 21 + 3 \times 31 \\ 4 \times 10 + 5 \times 20 + 6 \times 30 & 4 \times 11 + 5 \times 21 + 6 \times 31 \end{bmatrix}$$

$$= \begin{bmatrix} 10+40+90 & 11+42+93 \\ 40+100+180 & 44+105+186 \end{bmatrix} = \begin{bmatrix} 140 & 146 \\ 320 & 335 \end{bmatrix}$$

Operation with Tensors

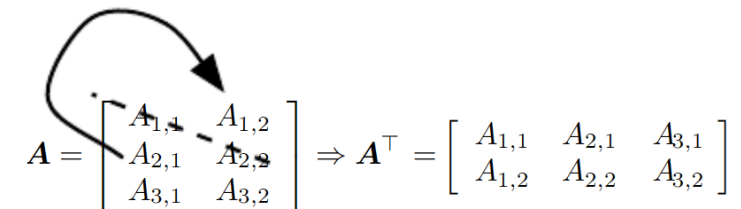

Operation with Tensors

Transpose

Transpose adalah hasil cermin Tensor terhadap suatu garis main diagonal. Transpose dari \mathbf{A} adalah \mathbf{A}^T , dengan

$$(\mathbf{A}^T)_{i,j} = A_{j,i}.$$

$$\mathbf{A} = \begin{bmatrix} A_{1,1} & A_{1,2} \\ A_{2,1} & A_{2,2} \\ A_{3,1} & A_{3,2} \end{bmatrix} \Rightarrow \mathbf{A}^T = \begin{bmatrix} A_{1,1} & A_{2,1} & A_{3,1} \\ A_{1,2} & A_{2,2} & A_{3,2} \end{bmatrix}$$

Identity (\mathbf{I}_n) and Inverse (\mathbf{A}^{-1})

$$\mathbf{I}_n \mathbf{x} = \mathbf{x} \quad \mathbf{A}^{-1} \mathbf{A} = \mathbf{I}_n$$

$$\mathbf{A} \mathbf{x} = \mathbf{b}$$

$$\mathbf{A}^{-1} \mathbf{A} \mathbf{x} = \mathbf{A}^{-1} \mathbf{b}$$

$$\mathbf{I}_n \mathbf{x} = \mathbf{A}^{-1} \mathbf{b}$$

$$\mathbf{x} = \mathbf{A}^{-1} \mathbf{b}$$

Operation with Tensors

Properties

- Transpose dari skalar adalah skalar itu sendiri

$$a = a^\top$$

- Scalar bisa dikalikan dan atau ditambahkan pada matriks

$$D = a \cdot B + c$$

dengan

$$D_{i,j} = a \cdot B_{i,j} + c$$

- Sifat perkalian matriks (*matrix product*)

A. Distributif

$$A(BC) = (AB)C$$

B. Asosiatif

$$A(B + C) = AB + AC$$

C. Tidak komutatif

$$(AB)^\top = B^\top A^\top$$

D. Bentuk transpose dari *matrix product*

$$x^\top y = (x^\top y)^\top = y^\top x$$

$X^{(4)}$

$X^{(3)}$

$X^{(2)}$

$X^{(1)}$

$\hat{y}^{(4)}$ $\hat{y}^{(3)}$ $\hat{y}^{(2)}$ $\hat{y}^{(1)}$

$$\sigma_1(X^{(n)} \cdot W_1 + b_1) = A_1$$

$$\sigma_2(A_1 \cdot W_2 + b_2) = A_2 = \hat{y}^{(n)}$$

Tensor Operations

$$a_1(X^{(n)} \cdot W_1 + b_1) = A_1$$

$$\dim(X^{(4)}) = (1, 3) \quad \dim(W_1) = (3, 2) \quad \dim(b_1) = (1, 2)$$

$$a_2(A_1 \cdot W_2 + b_2) = A_2 = \hat{y}^{(n)}$$

$$\dim(A_1) = (1, 2) \quad \dim(W_2) = (2, 1) \quad \dim(b_2) = (1, 1)$$

Kenapa butuh *activation function*?

Tumpukan persamaan linear adalah persamaan linear

$$f(x) = ax + b$$

$$g(x) = cx + d$$

$$f(g(x)) = cg(x) + d$$

$$= c(ax + b) + d$$

$$= acx + cb + d$$

$$= px + q = h(x) \leftarrow \text{persamaan linear!}$$

dengan $p = ac$, $q = cb + d$.

Kenapa butuh *activation function*?

Contoh: Masalah XOR

x_1	x_2	y
0	0	0
1	0	1
0	1	1
1	1	0

Kita butuh memasukkan sifat “nonlinearitas” ke dalam model.
